## NOTES

- a. Data are point and range estimates based on new estimation models developed by UNAIDS. Range estimates are presented in square brackets.
- b. Because of data limitations, comparisons across countries should be made with caution. Data for some countries may refer only to part of the country or differ from the standard definition.
- c. Data refer to all forms of tuberculosis.
- d. Calculated by dividing the new smear-positive cases of tuberculosis detected under DOTS, the internationally recommended tuberculosis control strategy, by the estimated annual incidence of new smear-positive cases. Values can exceed 100% because of intense case detection in an area

with a backlog of chronic cases, overreporting (for example, double counting), overdiagnosis or underestimation of incidence (WHO 2007b).

- e. Data are the share of new smear-positive cases registered for treatment under the DOTS case detection and treatment strategy that were successfully treated.

- f. The age range varies among countries, but in most is 18 and older or 15 and older.
- g. Data refer to the most recent year available during the period specified.
- h. Data refer to a period other than that specified.
- i. UN 2006a.
- j. UNICEF 2005.
- k. Data refer to 2005.
